

BUCKET LINE BL

Description:

The bucket line is the ideal solution for filling and sealing buckets. The empty bucket is placed on a conveyor either automatically or manually. Depending on the product, the bucket is filled using a vibrating sieve or a funnel with a filling head. The vibrating sieve or filling head stops automatically when the preset bucket weight is reached. The lids can be placed manually or via a lid applicator and then proceed to the lid pressing/sealing machine. After the bucket is sealed, it can, if desired, be washed, dried, coded, sealed, and/or labelled.

Advantages:

- Labor savings
- Accurate dosing
- Avoidance of heavy work

Options:

- Automatic bucket destacker
- Bottom-up filling
- Inspection by X-ray or metal detector
- Lid applicator
- Washing, drying, coding, sealing, and labelling

Technical specifications	
Model	BL
Production capacity	Depending on bucket size, product, and configuration
Package diameter	Min. ø 150 mm, Max. ø 400 mm
Electrical connection	400 V, 16A, 50 Hz
Dimensions (L x W x H)	Depending on configuration
Weight	Depending on configuration

LVS Technics
Filling & Closing
